INDICATIONS AND CLINICAL USE

Sandoz Ramipril (ramipril) is indicated for:

- **Treatment of Essential Hypertension.** It may be used alone or in association with thiazide diuretics or with the calcium channel blocker felodipine.

  The safety and efficacy of Sandoz Ramipril in renovascular hypertension have not been established and therefore, its use in this condition is not recommended.

Geriatrics (>65 years of age):
Although clinical experience has not identified differences in response between the elderly (>65 years) and younger patients, greater sensitivity of some older individuals cannot be ruled out (see ACTION AND CLINICAL PHARMACOLOGY, Pharmacokinetics).

Pediatrics (< 18 years of age)
The safety and effectiveness of Sandoz Ramipril in children have not been established. Therefore, Sandoz Ramipril is not indicated in this patient population.

CONTRAINDICATIONS

Ramipril is contraindicated in:

- Patients who are hypersensitive to this drug, to any other ACE inhibitor, or to any ingredient in the formulation. For a complete listing of ingredients, see Dosage Forms, Composition and Packaging section of the Product Monograph.
- Patients who have a history of angioedema.
- Pregnant women (see WARNINGS AND PRECAUTIONS, Special Populations, Pregnant Women).
- Nursing women (see WARNINGS AND PRECAUTIONS, Special Populations, Nursing Women).
- Patients with hemodynamically relevant bilateral renal artery stenosis, or unilateral in the single kidney (see WARNINGS AND PRECAUTIONS, Renal, Renal impairment).
- Patients with hypotensive states or hemodynamically unstable states.
- Combination with aliskiren-containing drugs in patients with diabetes mellitus (type 1 or type 2) and/or moderate to severe renal impairment (GFR<60 ml/min/1.73 m²) (see WARNINGS and PRECAUTIONS, Dual Blockade of the Renin-Angiotensin System (RAS) and Renal, and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin System (RAS)).
- Combination with angiotensin II receptor antagonists (ARBs) in patients with diabetic nephropathy [see WARNINGS and PRECAUTIONS, Dual Blockade of the Renin-Angiotensin System (RAS) and Renal, and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin System (RAS)].
- Combination with extracorporeal treatments leading to contact of blood with negatively charged surfaces since such use may lead to anaphylactoid reactions. Such extracorporeal treatments include dialysis or hemofiltration with certain high-flux (e.g. polyacrylonitril) membranes and low-density lipoprotein apheresis with dextran sulfate. (see WARNINGS AND PRECAUTIONS, Immune).

WARNINGS AND PRECAUTIONS

<table>
<thead>
<tr>
<th>Serious Warnings and Precautions</th>
</tr>
</thead>
<tbody>
<tr>
<td>When used in pregnancy, angiotensin converting enzyme (ACE) inhibitors can cause injury or even death of the developing fetus. When pregnancy is detected, ramipril should be discontinued as soon as possible (see WARNINGS AND PRECAUTIONS, Special Populations, Pregnant Women).</td>
</tr>
</tbody>
</table>

General Cough
A dry, persistent cough, which usually disappears only after withdrawal or lowering of the dose of ramipril, has been reported. Such possibility should be considered as part of the differential diagnosis of cough (see ADVERSE REACTIONS).

Driving a vehicle or performing other hazardous tasks
Some adverse effects (e.g. some symptoms of a reduction in blood pressure (BP) such as lightheadedness, dizziness, syncope) may impair the patient’s ability to concentrate and react and, therefore, constitute a risk in situations where these abilities are of particular importance (e.g. operating a vehicle or machinery).

Dual blockade of the Renin-Angiotensin System (RAS)
There is evidence that co-administration of ACE inhibitors, such as ramipril, or of ARBs with aliskiren increases the risk of hypotension, syncope, stroke, hyperkalemia and deterioration of renal function, including renal failure, in patients with diabetes mellitus (type 1 or type 2) and/or moderate to severe renal impairment (GFR<60 ml/min/1.73 m²). Therefore, the use of ramipril in
combination with aliskiren-containing drugs is contraindicated in these patients (see CONTRAINDICATIONS).

The use of ramipril in combination with an ARB is contraindicated in patients with diabetic nephropathy (see CONTRAINDICATIONS).

Further, co-administration of ACE inhibitors, including ramipril, with other agents blocking the RAS, such as ARBs or aliskiren-containing drugs, is generally not recommended in other patients, since such treatment has been associated with an increased incidence of severe hypotension, renal failure, and hyperkalemia (see DRUG INTERACTIONS).

**Cardiovascular**

**Aortic Stenosis**

There is concern, on theoretical grounds, that patients with aortic stenosis might be at particular risk of decreased coronary perfusion when treated with vasodilators because they do not develop as much afterload reduction.

**Hypotension**

Symptomatic hypotension has occurred after administration of ramipril, usually after the first or second dose or when the dose was increased. It is more likely to occur in patients who are volume depleted by diuretic therapy, dietary salt restriction, dialysis, diarrhea, vomiting, or in other situations in which a significant activation of the RAS is to be anticipated such as in patients with severe, and particularly malignant hypertension, in patients with hemodynamically relevant left-ventricular outflow impediment (e.g., stenosis of the aortic valve) or in patients with hemodynamically relevant renal artery stenosis. All patients should be cautioned about this potential excessive fall in BP and advised to consult their physician.

Generally, it is recommended that dehydration, hypovolaemia or salt depletion be corrected before initiating treatment (in patients with heart failure, however, such corrective action must be carefully weighed against the risk of volume overload). When these conditions have become clinically relevant, treatment with ramipril must only be started or continued if appropriate steps are taken concurrently to prevent an excessive fall in BP and deterioration of renal function.

In patients with ischemic heart disease or cerebrovascular disease, an excessive fall in BP could result in a myocardial infarction or cerebrovascular accident (see ADVERSE REACTIONS, Clinical Trial Adverse Drug Reactions). Because of the potential fall in BP in these patients, therapy with ramipril should be started under close medical supervision. Such patients should be followed closely for the first weeks of treatment and whenever the dose of ramipril is increased. In patients with severe congestive heart failure, with or without associated renal insufficiency, ACE inhibitor therapy may cause excessive hypotension and has been associated with oliguria, and/or progressive azotemia, and rarely, with acute renal failure and/or death.

If hypotension occurs, the patient should be placed in a supine position and, if necessary, receive an intravenous infusion of 0.9% sodium chloride. A transient hypotensive response may not be a contraindication to further doses which usually can be given without difficulty once the BP has increased after volume expansion in hypertensive patients. However, lower doses of ramipril and/or reduced concomitant diuretic therapy should be considered.
Ramipril may lower the state of patient alertness and/or reactivity; particularly at the start of treatment (see ADVERSE REACTIONS). Patients should be cautioned to report lightheadedness, especially during the first few days of ramipril therapy. If actual syncope occurs, the patients should be told to discontinue the drug and consult with their physician.

**Endocrine and metabolism**

**Hyperkalemia and Potassium-Sparing Diuretics**

Elevated serum potassium (> 5.7 mEq/L) was observed in approximately 1% of hypertensive patients in clinical trials treated with ramipril. In most cases these were isolated values which resolved despite continued therapy. Hyperkalemia was not a cause of discontinuation of therapy in any hypertensive patient. Risk factors for the development of hyperkalemia may include renal insufficiency, diabetes mellitus, and the concomitant use of agents to treat hypokalemia or other drugs associated with increases in serum potassium (see DRUG INTERACTIONS, Drug-Drug Interactions).

**Hematologic**

**Neutropenia/Agranulocytosis**

Agranulocytosis and bone marrow depression have been caused by ACE inhibitors. Several cases of agranulocytosis, neutropenia or leukopenia have been reported in which a causal relationship to ramipril cannot be excluded. Current experience with the drug shows the incidence to be rare. Hematological reactions to ACE inhibitors are more likely to occur in patients with impaired renal function and in those with concomitant collagen disease (e.g., lupus erythematosus or scleroderma) or in those treated with other drugs that may cause changes of the blood picture. Periodic monitoring of white blood cell counts should be considered (see WARNINGS AND PRECAUTIONS, Monitoring and Laboratory Tests, and ADVERSE REACTIONS, Less Common Adverse Drug reactions, Hematologic).

Patients should be told to report promptly to their physician any indication of infection (e.g. sore throat, fever) as this may be a sign of neutropenia (see ADVERSE REACTIONS, Post-Market Adverse Drug Reactions).

**Hepatic/Biliary**

Hepatitis (hepatocellular and/or cholestatic), elevations of liver enzymes and/or serum bilirubin have occurred during therapy with ACE inhibitors in patients with or without pre-existing liver abnormalities. In most cases the changes were reversed on discontinuation of the drug.

Elevations of liver enzymes and/or serum bilirubin have been reported with ramipril (see ADVERSE REACTIONS). Should the patient receiving ramipril experience any unexplained symptoms particularly during the first weeks or months of treatment, it is recommended that a full set of liver function tests and any other necessary investigations be carried out. Discontinuation of ramipril should be considered when appropriate.

There are no adequate studies in patients with cirrhosis and/or liver dysfunction. In patients with impaired liver function, response to the treatment with ramipril may be either increased or reduced. In addition, in patients in whom severe liver cirrhosis with oedema and/or ascites is
present, the RAS may be significantly activated. Ramipril should be used with particular caution in patients with pre-existing liver abnormalities. In such patients baseline liver function tests should be obtained before administration of the drug and close monitoring of response and metabolic effects should apply. (see ACTION AND CLINICAL PHARMACOLOGY, Special Populations and conditions, Hepatic Insufficiency).

Rarely, ACE inhibitors, including ramipril, have been associated with a syndrome that starts with cholestatic jaundice and progresses to fulminant hepatic necrosis and (sometimes) death. The mechanism of this syndrome is not understood. Patients receiving ACE inhibitors who develop jaundice or marked elevations of hepatic enzymes should discontinue the ACE inhibitor and receive appropriate medical follow-up.

**Immune**

**Angioedema - Head, and Neck or Extremities**

Angioedema has been reported in patients with ACE inhibitors including ramipril. Angioedema associated with laryngeal involvement may be fatal. If laryngeal stridor or angioedema of the face, extremities, lips, tongue, or glottis occurs, ramipril should be discontinued immediately, the patient treated appropriately in accordance with accepted medical care, and carefully observed until the swelling disappears. In instances where swelling is confined to the face and lips, the condition generally resolves without treatment, although antihistamines may be useful in relieving symptoms. Where there is involvement of tongue, glottis, or larynx, likely to cause airway obstruction, appropriate therapy (including, but not limited to 0.3 - 0.5 mL of subcutaneous epinephrine solution 1:1000) should be administered promptly (see ADVERSE REACTIONS, Clinical Trial Adverse Drug Reactions, Essential Hypertension, Less Common Clinical Trial Adverse Drug Reactions (<1%), Body as a whole).

An increased incidence of angioedema was observed in patients taking ACE inhibitors with mTOR inhibitors (mammalian target of rapamycin inhibitors) or vildagliptin (see DRUG INTERACTIONS).

**Angioedema — Intestinal**

Intestinal angioedema has been reported in patients treated with ACE inhibitors. These patients presented with abdominal pain (with or without nausea or vomiting); in some cases facial angioedema also occurred. The intestinal angioedema symptoms resolved after stopping the ACE inhibitor.

The incidence of angioedema during ACE inhibitor therapy has been reported to be higher in black than in non-black patients.

Patients with a history of angioedema unrelated to ACE inhibitor therapy may be at increased risk of angioedema while receiving an ACE inhibitor (see CONTRAINDICATIONS).

Angioedema, including laryngeal edema, may occur especially following the 1st dose of ramipril.

**Anaphylactoid Reactions During Membrane Exposure**

Anaphylactoid reactions have been reported in patients dialyzed with high-flux membranes [e.g. polyacrylonitrile (PAN)] and treated concomitantly with an ACE inhibitor. Therefore, the use of
Ramipril in patients dialyzed with high-flux membranes is contraindicated (see CONTRAINDICATIONS). Dialysis should be stopped immediately if symptoms such as nausea, abdominal cramps, burning, angioedema, shortness of breath and severe hypotension occur. Symptoms are not relieved by antihistamines. If such treatment is required, consideration should be given to using a different type of dialysis membrane or a different class of antihypertensive agents.

Anaphylactoid Reactions During LDL Apheresis
Rarely, patients receiving ACE inhibitors during low density lipoprotein apheresis with dextran sulfate have experienced life-threatening anaphylactoid reactions. These reactions were avoided by temporarily withholding the ACE inhibitor therapy prior to each apheresis. Therefore, the use of ramipril in patients receiving low density lipoprotein apheresis with dextran sulfate is contraindicated (see CONTRAINDICATIONS). If such treatment is required, consideration should be given to using a different type of apheresis or a different class of antihypertensive agents.

Anaphylactoid Reactions During Desensitization
There have been isolated reports of patients experiencing sustained life-threatening anaphylactoid reactions while receiving ACE inhibitors during desensitization treatment with hymenoptera (e.g. bees, wasps) venom. In the same patients, these reactions have been avoided when ACE inhibitors were temporarily withheld for ≥24 hours, but they have reappeared upon inadvertent rechallenge.

Nitritoid Reactions – Gold
Nitritoid reactions (symptoms include facial flushing, nausea, vomiting and symptomatic hypotension) have been reported rarely in patients on therapy with injectable gold (sodium aurothiomalate) and concomitant ACE inhibitor therapy including ramipril (see DRUG INTERACTIONS).

Peri-Operative Considerations
Surgery/Anesthesia
In patients undergoing surgery or anesthesia with agents producing hypotension, ramipril may block angiotensin II formation secondary to compensatory renin release. If hypotension occurs and is considered to be due to this mechanism, it may be corrected by volume repletion.

Renal
Renal impairment
As a consequence of inhibiting the renin-angiotensin-aldosterone system (RAAS), changes in renal function have been seen in susceptible individuals. In patients whose renal function may depend on the activity of the RAAS, such as patients with bilateral renal artery stenosis, unilateral renal artery stenosis to a solitary kidney, or severe congestive heart failure, treatment with agents that inhibit this system has been associated with oliguria, progressive azotemia, and rarely, acute renal failure and/or death. In susceptible patients, concomitant diuretic use may further increase risk; therefore, discontinuation of diuretic therapy may be required.
The use of ACE inhibitors – including ramipril – or ARBs with aliskiren-containing drugs is contraindicated in patients with moderate to severe renal impairment (GFR<60 ml/min/1.73m²).

(See CONTRAINDICATIONS and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin-System (RAS) with ARBs, or ACE inhibitors, or aliskiren-containing drugs).

Concomitant use of ACE inhibitors – including ramipril, with ARBs is contraindicated in patients with diabetic nephropathy due to risk of hyperkalemia, hypotension and renal impairment (see CONTRAINDICATIONS and DRUG INTERACTIONS, Dual Blockade of the Renin-Angiotensin-System (RAS) with ARBs, ACE inhibitors, or aliskiren-containing drugs).

Use of ramipril should include appropriate assessment of renal function.

Ramipril should be used with caution in patients with renal insufficiency as they may require reduced or less frequent doses (see DOSAGE AND ADMINISTRATION). Close monitoring of renal function during therapy should be performed as deemed appropriate in patients with renal insufficiency.

**Special Populations**

**Pregnant Women:** ACE inhibitors can cause fetal and neonatal morbidity and mortality when administered to pregnant women. When pregnancy is detected, ramipril should be discontinued as soon as possible, and, if appropriate, alternative therapy should be started. Patients planning pregnancy should be changed to alternative antihypertensive treatments which have an established safety profile for use in pregnancy.

The use of ACE inhibitors is contraindicated during pregnancy

Prematurity, and patent ductus arteriosus and other structural cardiac malformations, as well as neurologic malformations, have been reported following exposure in the first trimester of pregnancy.

The use of ACE inhibitors during the second and third trimesters of pregnancy has been associated with fetal and neonatal injury including hypotension, neonatal skull hypoplasia, anuria, reversible or irreversible renal failure, and death. Oligohydramnios has also been reported, presumably resulting from decreased fetal renal function, associated with fetal limb contractures, craniofacial deformation, and hypoplastic lung development.

Infants with a history of *in utero* exposure to ACE inhibitors should be closely observed for hypotension, oliguria, and hyperkalemia. If oliguria occurs, attention should be directed toward support of BP and renal perfusion. Exchange transfusion or dialysis may be required as a means of reversing hypotension and/or substituting for impaired renal function; however, limited experience with those procedures has not been associated with significant clinical benefit.

It is not known if ramipril or ramiprilat can be removed from the body by hemodialysis.

**Animal Data:** No teratogenic effects of ramipril were seen in studies of pregnant rats, rabbits, and cynomolgus monkeys at doses up to 2500x, 6.25x and 1250x, respectively, the maximum human dose. In rats, the highest dose (1000 mg/kg) caused reduced food intake in the dams, with
consequent reduced birth weights of the pups and weight development during the lactation period. In rabbits, maternal effects were mortalities (≥100 mg/kg) and reduced body weight. In monkeys, maternal effects were mortalities (≥50 mg/kg), vomiting, and reduced weight gain.

**Nursing Women:** The presence of concentrations of ACE inhibitor have been reported in human milk. The use of ramipril is contraindicated during breastfeeding.

**Pediatrics (< 18 years of age):** The safety and effectiveness of ramipril in children have not been established. Therefore, ramipril is not indicated in this patient population.

**Geriatrics (>65 years of age):** Although clinical experience has not identified differences in response between the elderly (>65 years) and younger patients, greater sensitivity of some older individuals cannot be ruled out. Evaluation of renal function at the beginning of treatment is recommended (see ACTION AND CLINICAL PHARMACOLOGY, Special Populations and Conditions, Geriatrics).

**Monitoring and Laboratory Tests**

**Hematological Monitoring**

It is recommended that the white blood cell count be monitored to permit detection of a possible leukopenia. More frequent monitoring is advised in the initial phase of treatment and in patients:

- with impaired renal function,
- those with concomitant collagen disease (e.g. lupus erythematosus or scleroderma) or
- those treated with other drugs that can cause changes in the blood picture (see DRUG INTERACTIONS, Drug-Drug Interactions, Allopurinol, Immunosuppressants, Corticosteroids, Procainamide, Cytostatics and other substances that may change the blood picture).

**Renal Function Monitoring**

Use of ramipril should include appropriate assessment of renal function, particularly in the initial weeks of treatment.

Particularly careful monitoring is required in patients with:

- heart failure
- renovascular disease (atherosclerotic renal artery stenosis (AS-RAS) and fibromuscular dysplasia (FMD)).
- impairment of renal function
- kidney transplant
- elderly patients

**Electrolyte monitoring**

It is recommended that serum potassium and serum sodium be monitored regularly. More frequent monitoring of serum potassium is necessary in patients with impaired renal function.

**ADVERSE REACTIONS**

**Adverse Drug Reaction Overview**
As ramipril is an antihypertensive; the most common adverse reactions are effects secondary to its blood-pressure-lowering action.

In long-term safety studies in patients with hypertension the most commonly reported serious adverse reactions were myocardial infarction (0.3%); edema (0.2%); hypotension (0.1%); cerebrovascular accident (0.1%); and syncope (0.1%). Angioedema occurred in 0.1% patients treated with ramipril and a diuretic.

The most frequent adverse events (AEs) occurring in these trials were: headache (15.1%); dizziness (3.7%); asthenia (3.7%); chest pain (2.0%); nausea (1.8%); peripheral edema (1.8%); somnolence (1.7%); impotence (1.5%); rash (1.4%); arthritis (1.1%); and dyspnea (1.1%). Discontinuation of therapy due to clinical AEs was required in 0.8% of patients treated with ramipril. Cough caused discontinuation of therapy approximately in 1% of patients in North American controlled clinical trials.

**Clinical Trial Adverse Drug Reactions**

*Because clinical trials are conducted under very specific conditions the adverse reaction rates observed in the clinical trials may not reflect the rates observed in practice and should not be compared to the rates in the clinical trials of another drug. Adverse drug reaction information from clinical trials is useful for identifying drug-related adverse events and for approximating rates.*

**Essential Hypertension**

Ramipril was evaluated for safety in > 4000 hypertensive patients. Almost 500 elderly patients participated in controlled trials. Long-term safety was assessed in almost 700 patients treated for ≥ 1 year. There was no increase in the incidence of adverse events in elderly patients given the same daily dose. The overall frequency of AEs was not related to duration of therapy or total daily dose.

Serious AEs occurring in North American placebo-controlled clinical trials with ramipril monotherapy in hypertension (n= 972) were: myocardial infarction (0.3%); edema (0.2%); hypotension (0.1%); cerebrovascular accident (0.1%); syncope (0.1%). Among all North American ramipril patients (n= 1244), angioedema occurred in 0.1% patients treated with ramipril and a diuretic.

The most frequent AEs occurring in these trials with ramipril monotherapy in hypertensive patients that were treated for ≥ 1 year (n=651) were: headache (15.1%); dizziness (3.7%); asthenia (3.7%); chest pain (2.0%); nausea (1.8%); peripheral edema (1.8%); somnolence (1.7%); impotence (1.5%); rash (1.4%); arthritis (1.1%); dyspnea (1.1%). Discontinuation of therapy due to clinical AEs was required in 5 patients (0.8%).

In placebo-controlled trials, an excess of upper respiratory infection and flu syndrome was seen in the ramipril group. As these studies were carried out before the relationship of cough to ACE inhibitors was recognized, some of these events may represent ramipril-induced cough. In a later 1-year study, increased cough was seen in almost 12% of ramipril patients, with about 4% of these patients requiring discontinuation of treatment. Approximately 1% of patients treated with
ramipril monotherapy in North American controlled clinical trials (n=972) have required discontinuation because of cough.

**Less Common Adverse Drug Reactions (<1%)**
Clinical AEs occurring in <1% of patients treated with ramipril in controlled clinical trials are listed below by body system:

**Body as a Whole:** angioedema.

**Cardiovascular:** angina pectoris, arrhythmia, chest pain, disturbed orthostatic regulation, exacerbation of perfusion disturbances due to vascular stenosis, flushing, myocardial infarction, palpitations, symptomatic-hypotension, syncope, tachycardia, vascular stenosis.

**CNS:** anxiety, amnesia, confusion, convulsions, depression, disorders of balance, hearing loss, impaired hearing, insomnia, lightheadedness, nervousness, neuralgia, neuropathy, paresthesia, polyneuritis, restlessness, sleep disturbances, somnolence, tinnitus, vertigo.

**Dermatologic:** apparent hypersensitivity reactions (with manifestations of urticaria, pruritus, or rash, with or without fever), photosensitivity, purpura.

In addition, the following cutaneous or mucosal reactions may occur: erythoderma/exfoliative dermatitis, maculopapular rash, maculopapular exanthema, onycholysis and psoriasiform exanthema.

**Gastrointestinal:** abdominal discomfort, abdominal pain (sometimes with enzyme changes suggesting pancreatitis), anorexia, constipation, diarrhea, digestive disturbances, decreased appetite, dry mouth, dyspepsia, dysphagia, gastritis, gastroenteritis, glossitis, increased levels of pancreatic enzymes, increased salivation, intestinal angioedema, nausea, pancreatitis (cases of fatal outcome have been very exceptionally reported), taste disturbance, upper abdominal pain, vomiting.

**Hematologic:** agranulocytosis, eosinophilia, leukopenia, thrombocytopenia (see WARNINGS AND PRECAUTIONS, Hematologic, Neutropenia/agranulocytosis section).

**Hepatobiliary:** increased hepatic enzymes and/or conjugated bilirubin. Rarely, ACE inhibitors, including ramipril, have been associated with a syndrome that starts with cholestatic jaundice and progresses to fulminant hepatic necrosis and (sometimes) death.

**Renal:** impaired renal function, oliguria and acute renal failure. Increases in blood urea nitrogen (BUN) and serum creatinine. Rarely, a deterioration of pre-existing proteinuria may develop (though ACE inhibitors usually reduce proteinuria) or an increase in urinary output (in connection with an improvement in cardiac performance).

**Respiratory:** bronchitis, bronchospasm (including aggravated asthma), increased cough, nasal congestion, sinusitis.
Other: arthralgia, arthritis, conjunctivitis, depressed mood, dyspnea, edema, epistaxis, impotence, increased sweating, loss of taste, malaise, muscle cramps, myalgia, reduced libido, transient erectile impotence, weight gain.

A symptom complex has been reported which may include fever, vasculitis, myalgia, arthralgia/arthritis, elevated erythrocyte sedimentation rate (ESR), eosinophilia and leukocytosis. Rash, photosensitivity or other dermatologic manifestations may also occur.

**Abnormal Hematologic and Clinical Chemistry Findings**
The following abnormal hematologic and clinical chemistry findings have been reported: decreases in red blood cell count, hemoglobin or hematocrit; elevations of liver enzymes, serum bilirubin, uric acid, blood glucose; hyponatremia; increased creatinine; increases in blood urea nitrogen (BUN); proteinuria and significant increases in serum potassium.

**Post-Market Adverse Drug Reaction**
**Body as a whole**: anaphylactoid reactions, angioedema (cases of fatal outcome have been reported), fatigue.

**Cardiovascular**: cerebrovascular disorders (including ischaemic stroke and transient ischaemic attack).

**CNS**: attention disturbances, burning sensation (mainly to skin of face or extremities), impaired psychomotor skills (impaired reactions), precipitation or intensification of Raynaud’s phenomenon, smell disturbances.

**Dermatologic**: erythema multiformes, exacerbation of psoriasis, lichenoid exanthema, pemphigoid exanthema and enanthema, pemphigus, reversible alopecia, Stevens-Johnson syndrome, toxic epidermal necrolysis.

**Endocrine**: Syndrome of inappropriate antidiuretic hormone secretion (SIADH).

**Gastrointestinal**: aphthous stomatitis

**Hematologic**: pancytopenia, bone marrow depression and hemolytic anemia (see WARNINGS AND PRECAUTIONS, Hematologic, Neutropenia/agranulocytosis section).

**Hepatobiliary**: acute hepatic failure, cholestatic or cytolytic jaundice, hepatitis (cases of fatal outcome have been very exceptional), in isolated cases liver damage (including acute liver failure) may occur.

**Laboratory test findings**: decrease in blood sodium.

**Other**: gynaecomastia, positive antinuclear antibodies (ANA).

**DRUG INTERACTIONS**
## Drug-Drug Interactions

### Table 1: Established or potential drug-drug interactions

### Proper name | Ref | Effect | Clinical comment
--- | --- | --- | ---
Warfarin | CT | The coadministration of ramipril with warfarin did not alter the anticoagulant effects. |  

**DOSAGE AND ADMINISTRATION**

**Recommended Dose and Dosage Adjustment**

**Essential Hypertension**
Dosage of Sandoz Ramipril must be individualized. Initiation of therapy requires consideration of recent antihypertensive drug treatment, the extent of blood pressure (BP) elevation and salt restriction. The dosage of other antihypertensive agents being used with Sandoz Ramipril may need to be adjusted.

**Monotherapy**
The recommended initial dosage of Sandoz Ramipril in patients not on diuretics is 2.5 mg once daily. Dosage should be adjusted according to BP response, generally, at intervals of ≥ 2 weeks. The usual dose range is 2.5 - 10 mg once daily. The maximum daily dose is 20 mg.

In some patients treated once daily, the antihypertensive effect may diminish towards the end of the dosing interval. This can be evaluated by measuring BP just prior to dosing to determine whether satisfactory control is being maintained for 24 hours. If it is not, either twice daily administration with the same total daily dose, or an increase in dose should be considered. If BP is not controlled with Sandoz Ramipril alone, a diuretic may be added. After the addition of a diuretic, it may be possible to reduce the dose of Sandoz Ramipril.

**Concomitant Diuretic Therapy**
Symptomatic hypotension occasionally may occur following the initial dose of Sandoz Ramipril and is more likely in patients who are currently being treated with a diuretic. The diuretic should, if possible, be discontinued for 2 - 3 days before beginning therapy with Sandoz Ramipril to reduce the likelihood of hypotension (see WARNINGS AND PRECAUTIONS). If the diuretic cannot be discontinued, an initial dose of 1.25 mg Sandoz Ramipril should be used with careful medical supervision for several hours and until BP has stabilized. The dosage of Sandoz Ramipril should subsequently be titrated (as described above) to the optimal response.

**Use in renal impairment**
For patients with a creatinine clearance < 40 mL/min/1.73m² (serum creatinine > 2.5 mg/dL), the recommended initial dose is 1.25 mg Sandoz Ramipril once daily. Dosage may be titrated upward until BP is controlled or to a maximum total daily dose of 5 mg. In patients with severe renal impairment (creatinine clearance < 10 mL/min/1.73m²), the maximum total daily dose is 2.5 mg Sandoz Ramipril.

**Use in hepatic impairment**

---

*C = Case Study; CT = Clinical Trial; T = Theoretical*
The response to the treatment with ramipril may be either increased or reduced. Treatment in these patients must therefore be initiated only under close medical supervision. The maximum permitted daily dose in such cases is 2.5 mg.

**OVERDOSAGE**

Limited data are available regarding overdosage with ramipril in humans; only 2 cases of overdosage have been reported.

In the case of an overdose with ramipril, the most likely clinical manifestation would be symptoms attributable to severe hypotension, which should normally be treated by intravenous volume expansion with normal saline.

Overdosage may cause excessive peripheral vasodilatation (with marked hypotension, shock), bradycardia, electrolyte disturbances, and renal failure.

| For management of a suspected drug overdose contact your regional Poison Control Centre immediately. |

**Management**

Primary detoxification by, for example, gastric lavage, administration of adsorbents, sodium sulfate; (if possible during the first 30 minutes). In the event of hypotension administration of $\alpha_1$-adrenergic agonists (e.g. norepinephrine, dopamine) or angiotensin II (angiotensinamide), which is usually available only in scattered research laboratories, must be considered in addition to volume and salt substitution.

No experience is available concerning the efficacy of forced diuresis, alteration in urine pH, haemofiltration, or dialysis in speeding up the elimination of ramipril or ramiprilat. If dialysis or haemofiltration is nevertheless considered, see also WARNINGS AND PRECAUTIONS, Immune, Anaphylactoid reactions during membrane exposure section.

**ACTION AND CLINICAL PHARMACOLOGY**

**Mechanism of Action**
Ramipril is an angiotensin converting enzyme (ACE) inhibitor.

Following oral administration, ramipril is rapidly hydrolyzed to ramiprilat, its principal active metabolite.

ACE catalyzes the conversion of angiotensin I to the vasoconstrictor substance, angiotensin II. Angiotensin II also stimulates aldosterone secretion by the adrenal cortex. Inhibition of ACE activity leads to decreased levels of angiotensin II thereby resulting in decreased vasoconstriction and decreased aldosterone secretion. The latter decrease may result in a small increase in serum potassium (see WARNINGS AND PRECAUTIONS, Endocrine and Metabolism, Hyperkalemia
and Potassium-Sparing Diuretics). Decreased levels of angiotensin II and the accompanying lack of negative feedback on renal renin secretion result in increases in plasma renin activity.

ACE is identical to kininase II. Thus, ramipril may also block the degradation of the vasodepressor peptide bradykinin, which may contribute to its therapeutic effect.

**Pharmacodynamics**

Administration of ramipril to patients with mild to moderate essential hypertension results in a reduction of both supine and standing BP usually with little or no orthostatic change or change in heart rate. Symptomatic postural hypotension is infrequent, although this may occur in patients who are salt-and/or volume-depleted (see WARNINGS AND PRECAUTIONS).

In single dose studies, doses of 5-20 mg of ramipril lowered BP within 1-2 hours, with peak reductions achieved 3-6 hours after dosing. At recommended doses given once daily, antihypertensive effects have persisted over 24 hours.

The effectiveness of ramipril appears to be similar in the elderly (> 65 years of age) and younger adult patients given the same daily doses.

In studies comparing the same daily dose of ramipril given as a single morning dose or as a twice daily dose, BP reductions at the time of morning trough blood levels were greater with the divided regimen.

While the mechanism through which ramipril lowers BP appears to result primarily from suppression of the renin-angiotensin-aldosterone system (RAAS), ramipril has an antihypertensive effect even in patients with low-renin hypertension.

The antihypertensive effect of ramipril and thiazide diuretics used concurrently is greater than that seen with either agent used alone.

Abrupt withdrawal of ramipril has not resulted in rapid increase in BP.

**Pharmacokinetics**

**Absorption:** Following oral administration, ramipril is rapidly absorbed with peak plasma concentrations occurring within 1 hour. The extent of absorption of ramipril is 50-60% and is not significantly altered by the presence of food in the gastrointestinal tract, although the rate of absorption is reduced.

Following a single administration of up to 5 mg of ramipril, plasma concentrations of ramipril and ramiprilat increase in a manner that is greater than proportional to dose; after a single administration of 5 mg to 20 mg of ramipril the plasma concentrations for both are dose-proportional. The non-linear pharmacokinetics observed at the lower doses of ramipril can be explained by the saturable binding of ramiprilat to ACE. At steady-state, the 24-hour AUC for ramiprilat is dose-proportional over the recommended dose range. The absolute bioavailabilities of ramipril and ramiprilat were 28% and 44% respectively when 5 mg of oral ramipril was compared to 5 mg given intravenously.
Plasma concentrations of ramiprilat decline in a triphasic manner. The initial rapid decline, which represents distribution of the drug, has a half life of 2-4 hours. Because of its potent binding to ACE and slow dissociation from the enzyme, ramipril shows 2 elimination phases. The apparent elimination phase has a half-life of 9-18 hours, and the terminal elimination phase has a prolonged half-life of >50 hours. After multiple daily doses of ramipril 5-10 mg, the half-life of ramiprilat concentrations was 13-17 hours, but was considerably prolonged at 2.5 mg (27-36 hours).

After once daily dosing, steady-state plasma concentrations of ramiprilat are reached by the 4th dose. Steady-state concentrations of ramiprilat are higher than those seen after the 1st dose of ramipril especially at low doses (2.5 mg).

**Distribution:** Following absorption, ramipril is rapidly hydrolyzed in the liver to its active metabolite, ramiprilat. Peak plasma concentrations of ramiprilat are reached 2-4 hours after drug intake. The serum protein binding of ramipril is about 73% and that of ramiprilat is 56%.

**Metabolism:** Ramipril is almost completely metabolized to the active metabolite ramiprilat, and to the diketopiperazine ester, the diketopiperazine acid, and the glucuronides of ramipril and ramiprilat, all of which are inactive.

**Excretion:** After oral administration of ramipril, about 60% of the parent drug and its metabolites is excreted in the urine, and about 40% is found in the feces. Drug recovered in the feces may represent both biliary excretion of metabolites and/or unabsorbed drug. Less than 2% of the administered dose is recovered in urine as unchanged ramipril.

**Special Populations and Conditions**

**Geriatrics:** A single dose pharmacokinetic study conducted in a limited number of elderly patients indicated that peak ramiprilat levels and the AUC for ramiprilat are higher in older patients (see WARNINGS AND PRECAUTIONS, Special Populations, Geriatrics).

**Race:** The antihypertensive effect of ACE inhibitors is generally lower in black patients than in non-blacks.

**Hepatic Insufficiency:** In patients with impaired liver function, plasma ramipril levels increased about 3-fold, although peak concentrations of ramiprilat in these patients were not different from those seen in patients with normal hepatic function.

**Renal Insufficiency:** The urinary excretion of ramipril, ramiprilat, and their metabolites is reduced in patients with impaired renal function. In patients with creatinine clearance <40 mL/min/1.73 m², increases in Cₘₐₓ and AUC of ramipril and ramiprilat compared to normal subjects were observed following multiple dosing with 5 mg ramipril (see DOSAGE AND ADMINISTRATION, Recommended Dose and Dosage Adjustment, Use in renal impairment).

**STORAGE AND STABILITY**
Store Sandoz Ramipril in original container between 15 and 30°C, protect from light and moisture and do not store beyond the date indicated on the container.

**DOSAGE FORMS, COMPOSITION AND PACKAGING**

**Availability of Dosage Forms**
1.25 mg tablet - white, oblong, flat tablet, debossed “R” and “1.25” on one side only.

2.5 mg tablet - white oblong, flat tablet, debossed “R” and “2.5” on one side only.

5 mg tablet - white, oblong, flat tablet, debossed “R” and “5” on one side only.

10 mg tablet - white, oblong, flat tablet, debossed “R” and “10” on one side only.

**Composition**
Sandoz Ramipril tablets contain the following ingredients: Ramipril, sodium hydrogen carbonate, hypromellose, microcrystalline cellulose, pregelatinized starch and sodium stearyl fumarate.

**Packaging**
Sandoz Ramipril is available in the following formats:
Al/Al blister packs of 30 tablets
HDPE bottles of 100 tablets
PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Drug Substance

Proper Name: Ramipril
Chemical Name: 2-[N-{(S)-1-ethoxycarbonyl-3-phenylpropyl}-L-alanyl]-(1S,3S,5S)-2-azabicyclo-[3.3.0]octane-3-carboxylic acid

Empirical Formula: C_{23}H_{32}N_{2}O_{5}
Molecular Mass: 416.52 g/mol

Structural Formula:

![Structural Formula Image]

Physicochemical Properties: A white to off-white crystalline powder with a melting point of 105°C to 112°C. Slightly soluble in water, and freely soluble in ethanol and methanol.
CLINICAL TRIALS

Comparative Bioavailability Study

Single dose crossover comparative bioavailability study of ramipril 10 mg tablets vs Altace® 10 mg capsules in 40 healthy male volunteers (18 to 50 years old) was conducted under fasted conditions. Bioavailability data were measured and the results are summarized in the following table.

</table>

The symptoms observed in mice were decreased spontaneous activity, crouching, hypothermia, dyspnea, and clonic convulsions; deaths occurred within 30 minutes after IV and 24 hours after oral administration. In survivors, the symptoms disappeared by 1 - 5 days after administration; necropsies revealed no abnormality in any of the surviving animals. In rats, reduced spontaneous activity was noted (oral administration), while after IV administration similar signs occurred as in mice; the sign of lethal toxicity was clonic convulsions (IV administration).

</table>

**Mutagenicity:**
Ramipril was not mutagenic in the Ames microbial mutagen test, the HGPRT test in V79 cells, the micronucleus test in mice and the UDS test in human A549 cells.

**Carcinogenicity:**
There was no evidence of a carcinogenic effect when ramipril was administered for 104 weeks to NMRI mice at doses ≤1000 mg/kg/day and to Wistar rats at doses ≤500 mg/kg/day.

PART III: CONSUMER INFORMATION

Pr*SANDOZ RAMIPRIL (ramipril tablets)

Read this carefully before you start taking Sandoz Ramipril and each time you get a refill. This leaflet is a summary and will not tell you everything about Sandoz Ramipril. Talk to your doctor, nurse, or pharmacist about your medical condition and treatment and ask if there is any new information about Sandoz Ramipril.

ABOUT THIS MEDICATION

What the medication is used for:
High Blood Pressure (Hypertension)
Sandoz Ramipril lowers high blood pressure. It can be used alone or together with a diuretic (“water pill”).

Managing your lifestyle:

Keeping your blood pressure controlled
It takes more than just medication to reduce blood pressure. Discuss the risk factors, and how they apply to your lifestyle, with your doctor. You may have to modify some of your daily habits to keep your blood pressure down.

Exercise regularly. It will help to keep your weight down, make you feel more energetic and is a good way to deal with stress. If you are not exercising regularly, be sure to discuss a fitness plan with your doctor.

Remember, hypertension is a long-term disease without symptoms. Just because you feel fine does not mean you can stop taking your medication. If you stop, serious complications of the disease may occur. Therefore, you should continue to take Sandoz Ramipril regularly, as prescribed by your doctor.

The “lifestyle” part of your treatment is as important as your medication. By working as a team with your doctor, you can help reduce the risk of complications to maintain the style of life you are accustomed to.

- Alcohol: Avoid alcoholic beverages until you have discussed their use with your doctor. Alcohol consumption may alter your blood pressure and/or increase the possibility of dizziness or fainting.
- Diet: Generally, avoid fatty foods and food that is high in salt or cholesterol.
- Smoking: Avoid it completely.

What it does:
Sandoz Ramipril is an angiotensin converting enzyme (ACE) inhibitor. You can recognize ACE inhibitors because their medicinal ingredient ends in “-PRIL”.
This medicine does not cure your disease. It helps to control it. Therefore, it is important to continue taking Sandoz Ramipril regularly even if you feel fine.

When it should not be used:
Do not take Sandoz Ramipril if you:
- Are allergic to ramipril or to any non-medicinal ingredient in the formulation.
- Have experienced an allergic reaction (angioedema) with swelling of the hands, feet, or ankles, face, lips, tongue, throat, or sudden difficulty breathing or swallowing, to any ACE inhibitor or without a known cause. Be sure to tell your doctor, nurse, or pharmacist that this has happened to you.
- Have been diagnosed with hereditary angioedema: an increased risk of getting an allergic reaction that is passed down through families. This can be triggered by different factors, such as surgery, flu, or dental procedures.
- Are pregnant or intend to become pregnant. Taking Sandoz Ramipril during pregnancy can cause injury and even death to your baby.
- Are breastfeeding. Ramipril passes into breast milk.
- Have narrowing of the arteries to one or both kidneys (renal artery stenosis).
- Have hypotension (low blood pressure).
- Are on dialysis or LDL apheresis (a treatment to remove LDL cholesterol from the blood).
- Have diabetes or kidney disease and are already taking:
  - a blood pressure-lowering medicine that contains aliskiren (such as Rasilez).
  - an angiotensin receptor blocker (ARB). You can recognize an ARB because its medicinal ingredient ends in “-SARTAN”.

What the medicinal ingredient is:
Ramipril

What the important nonmedicinal ingredients are:
Hyromellose, microcrystalline cellulose, pregelatinized starch, sodium hydrogen carbonate and sodium stearyl fumarate.

What dosage forms it comes in:
Tablets 1.25 mg, 2.5 mg, 5 mg and 10 mg.

WARNINGS AND PRECAUTIONS

Serious Warnings and Precautions - Pregnancy
Sandoz Ramipril should not be used during pregnancy. If you discover that you are pregnant while taking ramipril, stop the medications and please contact your doctor, nurse, or pharmacist as soon as possible.

BEFORE you use Sandoz Ramipril talk to your doctor, nurse, or pharmacist if you:
- Are allergic to any drug used to lower blood pressure.
- Have recently received or are planning to get allergy shots for bee or wasp stings.
• Have narrowing of an artery or a heart valve.
• Have had a heart attack or stroke.
• Have heart failure.
• Have diabetes, liver or kidney disease.
• Are on dialysis or LDL apheresis (a treatment to remove LDL cholesterol from the blood).
• Are dehydrated or suffer from excessive vomiting, diarrhea, or sweating.
• Are taking a salt substitute that contains potassium, potassium supplements, or a potassium-sparing diuretic (a specific kind of “water pill”), or other medicinal products that may increase potassium. Use of Sandoz Ramipril with these medicines is not recommended.
• Are on a low-salt diet.
• Are receiving gold (sodium aurothiomalate) injections.
• Are less than 18 years old.
• Are taking a medicine that contains aliskiren, such as Rasilez, used to lower high blood pressure. The combination with Sandoz Ramipril is not recommended.
  • Are taking an angiotensin receptor blocker (ARB). You can recognize an ARB because its medicinal ingredient ends in “-SARTAN”. The combination with Sandoz Ramipril is not recommended.

You may become sensitive to the sun while taking Sandoz Ramipril. Exposure to sunlight should be minimized until you know how you respond.

If you are going to have surgery and will be given an anesthetic, be sure to tell your doctor or dentist that you are taking Sandoz Ramipril.

Driving and using machines: Before you perform tasks which may require special attention, wait until you know how you respond to Sandoz Ramipril. Dizziness, lightheadedness, or fainting can especially occur after the first dose and when the dose is increased.

Raynaud's phenomenon is a condition resulting from poor circulation in the extremities (i.e., fingers and toes). It may begin or get worse.

INTERACTIONS WITH THIS MEDICATION

As with most medicines, interactions with other drugs are possible. Tell your doctor, nurse, or pharmacist about all the medicines you take, including drugs prescribed by other doctors, vitamins, minerals, natural supplements, or alternative medicines.

The following may interact with Sandoz Ramipril:
  • Agents increasing serum potassium, such as a salt substitute that contains potassium, potassium supplements, or a potassium-sparing diuretic (a specific kind of “water pill”), or other medicinal products that may increase potassium. Use of Sandoz Ramipril with these medicines is not recommended.
  • Alcohol
  • Allopurinol used to treat gout.
  • Antidiabetic drugs, including insulin and oral medicines, in particular vildagliptin.
  • Lithium used to treat bipolar disease.
  • Gold for the treatment of rheumatoid arthritis.
  • Nonsteroidal anti-inflammatory drugs (NSAIDs), used to reduce pain and swelling. Examples include ibuprofen, naproxen, and celecoxib.
  • Blood pressure lowering drugs, including diuretics (“water pills”), aliskiren-containing products (e.g. Rasilez), or angiotensin receptor blockers (ARBs).
  • Nitrates used to treat angina (chest pain)
  • Acetylsalicylic acid (aspirin)
  • Heparin used to prevent and treat blood clots
  • Immunosuppressants used to lower the body’s ability to reject a transplanted organ
  • Corticosteroids used to treat joint pain and swelling or for other conditions.
  • Procainamide used to treat irregular heartbeat
  • Cytostatic medicines used to treat certain types of cancer
  • mTOR inhibitors (e.g. temsirolimus) used to lower the body’s ability to reject a transplant or to treat certain types of cancer

PROPER USE OF THIS MEDICATION

Take Sandoz Ramipril exactly as prescribed. It is recommended to take your dose at about the same time every day.

Usual adult dose:

High Blood Pressure: The recommended initial dosage of Sandoz Ramipril is 2.5 mg once daily. Your doctor will determine the appropriate dosage.

For patients taking diuretics (“water pills”) or with impaired kidney function: The recommended initial dosage of ramipril is 1.25 mg daily.

Overdose:

If you think you have taken too much Sandoz Ramipril contact your doctor, nurse, pharmacist, hospital emergency department or regional Poison control Centre immediately, even if there are no symptoms..

Missed Dose:

If you have forgotten to take your dose during the day, carry on with the next one at the usual time. Do not double dose.

SIDE EFFECTS AND WHAT TO DO ABOUT THEM

Side effects may include:
  • dizziness difficulty in maintaining your balance while standing
  • drowsiness, fatigue, weakness
- cough, nasal or sinus congestion, swollen lymph nodes, bronchitis, aggravated asthma
- rash, itching, flushing, inflammation of the eye (pink eye), skin inflammation or red skin, burning sensation, inflammation of the mouth or tongue
- headache
- abdominal pain
- sad mood, difficulty with sleep, restlessness, attention disturbances
- loss of hair taste modifications or loss of taste, vision or hearing modifications impotence/reduced libido, breast enlargement in males

**If any of these affects you severely, tell your doctor, nurse or pharmacist.**

Sandoz Ramipril can cause abnormal blood test results. Your doctor will decide when to perform blood tests and will interpret the results.

### HOW TO STORE IT

Store in original container between 15 and 30°C, protect from light and moisture and do not store beyond the date indicated on the container.

Keep out of reach of children.
REPORTING SUSPECTED SIDE EFFECTS

You can report any suspected adverse reactions associated with the use of health products to the Canada Vigilance Program by one of the following 3 ways:

- Report online at www.healthcanada.gc.ca/medeffect
- Call toll-free at 1-866-234-2345
- Complete a Canada Vigilance Reporting Form and:
  - Fax toll-free to 1-866-678-6789, or
  - Mail to: Canada Vigilance Program
    Health Canada
    Postal Locator 0701E
    Ottawa, Ontario
    K1A 0K9

Postage paid labels, Canada Vigilance Reporting Form and the adverse reaction reporting guidelines are available on the MedEffect™ Canada Web site at www.healthcanada.gc.ca/medeffect.

NOTE: Should you require information related to the management of side effects, contact your health professional. The Canada Vigilance Program does not provide medical advice.
