INDICATIONS AND CLINICAL USE

Dimenhydrinate Injection USP and Sandoz Dimenhydrinate (dimenhydrinate) are indicated for use in the prevention and relief of nausea, vomiting and/or vertigo. These symptoms may be associated with clinical situations such as motion sickness, radiation sickness, postoperative recovery, drug-induced nausea and vomiting, Ménière's disease and other labyrinthine disturbances. Parenteral therapy is available when rectal therapy is inappropriate.

Geriatrics (> 65 years of age):
See WARNINGS AND PRECAUTIONS —Special Populations, Geriatrics.
Pediatrics:

- **< 2 years of age:** The safety and efficacy of Dimenhydrinate Injection USP in children under the age of 2 have not been established. Dimenhydrinate Injection USP should not be used in this population.
- **< 12 years of age:** The safety and efficacy of Sandoz Dimenhydrinate in children under the age of 12 have not been established. Sandoz Dimenhydrinate should not be used in this population.

**CONTRAINDICATIONS**

- Patients who are hypersensitive to dimenhydrinate or its components (diphenhydramine or 8-chlorotheophylline) or to any ingredient in the formulations or component of the container. For a complete listing, see the DOSAGE FORMS, COMPOSITION AND PACKAGING
- During or within two weeks following therapy with a monoamine oxidase inhibitor (see DRUG INTERACTIONS, Drugs with Anticholinergic Effects)
- Patients with glaucoma (narrow angle)
- Patients with chronic lung disease
- Patients with prostatic hypertrophy
- Patients under 2 years of age for Dimenhydrinate Injection USP
- Patients under 12 years of age for Sandoz Dimenhydrinate

**WARNINGS AND PRECAUTIONS**

**General**

Dimenhydrinate Injection USP for IM administration contains 50% (v/v) propylene glycol and is for intramuscular injection only. In exceptional circumstances, if Dimenhydrinate Injection USP for IM administration is required for intravenous use, it must be diluted at least 1:10 with a compatible physiological solution such as sterile saline or 5% dextrose in water, to prevent propylene glycol-associated cardiogenic shock (see DOSAGE AND ADMINISTRATION, Dosing Considerations).

**DIMENHYDRINATE INJECTION USP AND SANDOZ DIMENHYDRINATE ARE NOT INTENDED FOR PROLONGED USE EXCEPT ON THE ADVICE OF A PHYSICIAN.**

Dimenhydrinate may impair the ability to perform hazardous activities requiring mental alertness or physical coordination such as operating machinery or driving a car.

The concomitant use of alcohol or other central nervous system depressants may have an additive effect and should be avoided.

**Abuse/Dependence/Tolerance**
Dimenhydrinate Injection USP and Sandoz Dimenhydrinate (dimenhydrinate) have substance abuse potential due to their hallucinogenic and euphoric effects. At higher doses, confusion, hallucinations, temporary amnesia and paranoia may occur. Chronic abuse of antihistamines can lead to drug interaction accidents, overdose, and in extreme cases to death (see OVERDOSE). Withdrawal symptoms may include lethargy, agitation, hostility, clumsiness, nausea, vomiting, hallucinations, confusion and aggression.

**Cardiovascular**
Use with caution in patients with cardiac arrhythmias or cardiovascular disease (including hypertension and ischemic heart disease).

**Ear/Nose/Throat**
Dimenhydrinate may mask the presence of underlying organic abnormalities or the toxic effects of certain antibiotics and other drugs, particularly those drugs causing ototoxicity.

**Endocrine and Metabolism**
Use with caution in patients who are poor CYP2D6 metabolizers and in patients with thyroid dysfunction.

**Gastrointestinal**
Use with caution in patients with pyloroduodenal obstruction (including stenotic peptic ulcer).

**Genitourinary**
Dimenhydrinate Injection USP and Sandoz Dimenhydrinate are contraindicated in patients with prostatic hyperplasia (see CONTRAINDICATIONS). Use with caution in patients with other genitourinary obstruction.

**Hematologic**
Rarely, prolonged therapy with antihistaminic drugs can produce blood dyscrasia. Use with caution in patients with porphyria.

**Hepatic/Biliary/Pancreatic**
Use with caution in patients with hepatic impairment.

**Neurologic**
Dimenhydrinate should be used with caution in patients with seizure disorders.

**Ophthalmologic**
Dimenhydrinate Injection USP and Sandoz Dimenhydrinate are contraindicated in patients with increased intraocular pressure or narrow angle glaucoma (see CONTRAINDICATIONS).

**Psychiatric**
Dimenhydrinate may cause euphoria, hallucination, confusion, and paranoia at higher doses (see WARNINGS AND PRECAUTIONS, Abuse/Dependence/Tolerance).
Respiratory
Dimenhydrinate Injection USP and Sandoz Dimenhydrinate are contraindicated in patients with chronic lung disease such as chronic obstructive pulmonary disease (see CONTRAINDICATIONS). Use with caution in patients with a history of asthma or lower respiratory tract symptoms.

Skin
In rare cases, serious skin reactions such as Stevens-Johnson syndrome, toxic epidermal necrolysis, and erythema multiform have been associated with the use of dimenhydrinate. Because the rate of these reactions is low, they have usually been noted during post-marketing surveillance in patients taking other medications also associated with the potential development of these serious skin reactions. Thus, causality is NOT clear. These reactions are potentially life threatening but may be reversible if the causative agent is discontinued and appropriate treatment instituted. Patients should be advised that if they experience a skin rash they should discontinue dimenhydrinate and contact their physician for assessment and advice, including which additional therapies to discontinue.

Special Populations
Pregnant Women: The use of dimenhydrinate by women who are pregnant or may become pregnant requires that the potential benefits be weighed against the potential hazards. There are no adequate and well-controlled studies with dimenhydrinate in pregnant women. Reproduction studies in rats and rabbits using dimenhydrinate doses up to 20 and 25 times the human dose (mg/kg), respectively, have not revealed evidence of harm to the fetus or impaired fertility.

Nursing mothers: Small amounts of dimenhydrinate are excreted in breast milk. Because of the potential for adverse reactions in nursing infants from dimenhydrinate, a decision should be made whether to discontinue nursing or to discontinue the drug, taking into account the importance of the drug to the mother.

Labour and Delivery: The safety of dimenhydrinate injection given during labour and delivery has not been established. Reports have indicated dimenhydrinate may have oxytocic effect. Caution is advised when this effect is unwanted or in situations where it may prove detrimental.

Geriatrics: Older adults may be more sensitive to the side effects of this drug, especially drowsiness, confusion, constipation, or trouble urinating. Drowsiness and confusion can increase the risk of falling. Dimenhydrinate may be inappropriate in older adults depending on comorbidities (e.g. dementia, delirium, etc.) due to its potent anticholinergic effects.

Pediatrics (< 12 years of age): For infants and children especially, antihistamines in overdosage may cause hallucinations, convulsions, or death (see CONTRAINDICATIONS). As in adults, antihistamines may diminish mental alertness in pediatric patients. Antihistamines may also produce excitation in younger children.

Dimenhydrinate Injection USP is not recommended for children under 6 years of age.
Sandoz Dimenhydrinate is not recommended for children under 12 years of age.

Discontinue use and contact the physician if symptoms of paradoxical excitation (restlessness, nervousness, hallucinations, delirium, or seizures), especially in small children, occur.

ADVERSE REACTIONS

Drowsiness and dizziness are reported most frequently, particularly on high dosage. Pain may occur at the site of IM injection. Since dimenhydrinate contains 50% diphenhydramine, the possibility of diphenhydramine side effects must also be considered.

The following adverse reactions have also been reported:

Blood and lymphatic system disorders: anemia, thrombocytopenia, agranulocytosis, leukopenia, pancytopenia.

Body as a whole - general disorders: lassitude, fatigue, drug withdrawal syndrome, injection site inflammation.

Cardiac disorders: tachycardia, palpitations, hypotension, arrhythmia.

Ear and labyrinth disorders: tinnitus, labyrinthitis, vertigo.

Eye disorders: mydriasis, vision blurred, diplopia.

Gastrointestinal disorders: epigastric distress, nausea, dry mouth, constipation, diarrhea, vomiting

General disorders and administration site conditions: oedema.

Immune system disorders: hypersensitivity, anaphylactic reaction.

Metabolism and nutrition disorders: anorexia, decreased appetite.

Nervous system disorders: dizziness, headache, impaired coordination, somnolence, tremor, paraesthesia, ataxia, athetosis, convulsion, seizure, memory impairment, loss of consciousness.

Psychiatric disorders: depression, insomnia, hallucination, anxiety, confusional state, excitation, euphoric mood, nightmares, delirium, irritability, nervousness, restlessness, agitation.

Respiratory, thoracic, and mediastinal disorders: thickening of bronchial secretions, respiratory depression, dyspnoea.
Renal and urinary disorders: dysuria, urinary retention.

Skin and subcutaneous tissue disorders: angioedema, hyperhidrosis, rash, rash erythematous, rash maculopapular, pruritus, urticaria, fixed drug eruption, Stevens-Johnson syndrome, toxic epidermal necrolysis, erythema multiform, photosensitivity.

Vascular disorders: hypotension, hypertension, flushing.

DRUG INTERACTIONS

Drug-Drug Interactions

CNS Depressants: Dimenhydrinate may enhance the effects of alcohol, barbiturates, tranquilizers, sedatives, or hypnotics. Caution must therefore be used, to avoid overdose.

Drugs with Anticholinergic Effects: Because dimenhydrinate also has anticholinergic activity, it may potentiate the effects of other drugs with anticholinergic activity including tricyclic antidepressants, MAO inhibitors, and antihistamines. Solid potassium dose forms should be avoided as anticholinergics may slow gastrointestinal transit resulting in local exposure to high potassium concentrations.

Ototoxic Drugs: When given concurrently with aminoglycoside antibiotics or other ototoxic drugs, dimenhydrinate may mask the early symptoms of ototoxicity (see WARNINGS AND PRECAUTIONS).

Incompatibility: the incompatible substance with injectable preparations of dimenhydrinate include: phenothiazine derivatives, aminophylline, ammonium chloride, sodium amobarbital, diphenylhydantoin, sodium heparin, hydrocortisone sodium succinate, pentobarbital, phenobarbital, thiopental and certain types of antibiotics (tetracycline HCl).

Drug-Laboratory Interactions

As for other antihistamines, dimenhydrinate may inhibit the cutaneous histamine response in skin tests using allergen extracts, thus producing false-negative results. It is recommended that dimenhydrinate be discontinued at least 72 hours before testing.

DOSAGE AND ADMINISTRATION

Dosing Considerations

Dimenhydrinate Injection USP 50 mg/mL is designed for intramuscular use only and must not be used intravenously (IV) unless it has been diluted (see Intravenous Dilution Instructions below). Diluted Dimenhydrinate Injection USP, prepared for IV use, should be administered by slow intravenous injection only (over 2 minutes).

Dimenhydrinate Injection USP (10 mg/mL) for IV use is not for arterial use.
Consult physical compatibility information (see Stability and Storage Recommendations) before mixing parenteral solutions.

Dimenhydrinate Injection USP and Sandoz Dimenhydrinate are not intended for prolonged use except upon advice of the physician.

Dimenhydrinate Injection USP is not recommended for children under 6 years of age, unless directed by the physician.

Sandoz Dimenhydrinate is not recommended for children under 12 years of age, unless directed by the physician.

**Intravenous Dilution Instructions**
For IV administration, each 1 mL of Dimenhydrinate Injection USP 50 mg/mL must be diluted at least 1:10 with a compatible physiological solution such as sterile saline or 5% dextrose in water, to prevent propylene glycol-associated cardiogenic shock.

Diluted solutions can be stored up to 24 hours at room temperature. Dimenhydrinate Injection USP is never to be injected intra-arterially. Always inspect the solution visually for particulate matter and discoloration prior to administration. Discard any unused portions.

For IV administration, the Dimenhydrinate Injection USP (10 mg/mL) must be administered as a slow IV injection (2 to 4 minutes).

**Recommended Dose and Dosage Adjustment**

*Motion Sickness*

**Adults**

**Rectal:** 50 mg - 100 mg Sandoz Dimenhydrinate suppository every 6-8 hours as necessary. For ease and comfort, smooth any edges on suppository prior to use.
Dosage should be taken at least 30 minutes, and preferably 1 or 2 hours before travelling. Do not use more than 4 suppositories in 24 hours.

**Children:**

≥ 12 years of age: **Rectal:** 50 mg every 8 to 12 hours as necessary. Dosage should be taken at least 30 minutes, and preferably 1 or 2 hours before travelling. Do not use more than 3 suppositories in 24 hours.

*Radiation Sickness*

**Pre-Therapy: Adults:** 50 mg - 100 mg administered rectally or parenterally, 30 to 60 minutes before treatment. This dose is repeated as necessary to a maximum of 400 mg within 24 hours.

**Post-therapy: Adults:** 50 mg IM or IV 1½ hours post-therapy and 50 mg IM or IV 3 hours post-therapy.
To divide a suppository in two equal parts, remove from packaging and carefully cut with a sharp edge blade through the suppository.

Postoperative Nausea/Vomiting
Adults: 50 mg IM or IV as preoperative dose, to be followed postoperatively by similar doses as needed to a maximum of 400 mg within 24 hours.

Children:
- Over 12 years of age: 50 mg IM or IV two or three times daily
- 8 to 12 years of age: 25 mg - 50 mg IM or IV two or three times daily
- 6 to 7 years of age: 15 mg - 25 mg IM or IV two or three times daily

Post-surgical/Post-anesthetic
Adult: 50 mg IM or IV, immediately after surgery, then: 50 mg IM or IV, every 4 hours for 3 doses.

Children:
- Over 12 years of age: 50 mg IM or IV two or three times daily
- 8 to 12 years of age: 25 mg - 50 mg IM or IV two or three times daily
- 6 to 7 years of age: 15 mg - 25 mg IM or IV two or three times daily

Missed Dose
If a dose is missed and Dimenhydrinate Injection USP or Sandoz Dimenhydrinate are being taken regularly, they should be taken as soon as possible. However, if it is almost time for the next dose, the missed dose should be skipped. The maximum daily dose should not be exceeded.

OVERDOSE

Symptoms: Accidental antihistamine overdose occurs frequently in infants and children. Symptoms of dimenhydrinate toxicity in children may resemble atropine overdosage, and include dilated pupils, flushed face, excitation, hallucinations, confusion, ataxia, intermittent clonic convulsions, coma, cardiorespiratory collapse, and death. Symptoms may be delayed up to 2 hours after ingestion; death may occur within 18 hours.

In adults, 500 mg or more of dimenhydrinate may cause extreme difficulty in speech and swallowing, and produces a psychosis indistinguishable from that of atropine poisoning. CNS excitation may be preceded by sedation, leading to a cycle of CNS excitation, seizures, and postictal depression.

Treatment: Treatment of dimenhydrinate toxicity is symptomatic and supportive. Emetics are usually ineffective but in the absence of seizures, early gastric lavage (with an endotracheal tube with cuff inflate in place to prevent aspiration of gastric contents) may be beneficial. Patients should be kept quiet, to minimize CNS stimulation; seizures may be treated with diazepam in...
adults and phenobarbital in children (additional methods may include IV sodium bicarbonate, or IV physostigmine salicylate in children). Mechanical respiratory assistance may be required.

Positive and negative mode of ion mobility spectrometry (IMS) and ion mobility spectrometry/mass spectrometry (IMS/MS) have shown efficacy for the preliminary screening of emergency patients suspected of dimenhydrinate and other drug overdose.

For management of suspected drug overdose, contact your regional Poison Control Centre.

**ACTION AND CLINICAL PHARMACOLOGY**

**Mechanism of Action**
Dimenhydrinate is a theoclate salt of the ethanolamine derivative diphenhydramine. The content ratio varies from 53% - 55.5% for diphenhydramine, and 44% - 47% for 8- chlorotheophylline. The mechanism by which dimenhydrinate exerts its antiemetic, anti-motion sickness, and antivertigo effects is not precisely known, but may possibly be related to its central anticholinergic action. Other actions may involve an effect on the medullary chemoreceptor trigger zone or dose-related inhibition of vestibular stimulation (i.e., first acting on the otolith system and in larger doses on the semicircular canals).

**Pharmacokinetics**
Dimenhydrinate is well absorbed after oral administration. Antiemetic effects occur almost immediately after IV administration, within 20-30 minutes after IM administration and 15-30 minutes after oral administration. In a study of 9 healthy volunteers given a single dose of each dosage form (separated by a washout period), T\textsubscript{max} and C\textsubscript{max} are given in the following table.

<table>
<thead>
<tr>
<th>Product</th>

<td>112.2</td>
</tr>
</tbody>
</table>

Serum concentrations (ng/mL) 1 and 2 hours after administration of a 50 mg dimenhydrinate tablet were: 3.65 and 3.15. While not directly applicable to dimenhydrinate, it is suggested that when plasma concentration of diphenhydramine exceeds 70 ng/mL, sleep may occur.

Dimenhydrinate, like diphenhydramine, is widely distributed into body tissues, and crosses the placenta. Small amounts of dimenhydrinate are distributed into milk. After oral administration of 4x50 mg dimenhydrinate tablets, a distribution volume of 3-4 L/kg, and protein binding of 70-85% for dimenhydrinate and 98-99% for diphenhydramine were reported. The duration of effect and therapeutic plasma level were respectively 4-6 hours and 0.1mcg/mL. The plasma
elimination half-life was 5-8 hours.

Dimenhydrinate is metabolized by the liver, and excreted in urine. There are three known metabolites: diphenyl-methoxy-ethylamine, diphenyl-methoxy-acetic acid, and diphenyl-methoxy-N-methylamine.

DOSAGE FORMS, COMPOSITION AND PACKAGING

NMI = Non-medicinal ingredients

**Dimenhydrinate Injection USP for IM administration or IV administration if diluted**

**Ampoules 50 mg/mL**

*Active:* 50 mg dimenhydrinate.
*NMI:* propylene glycol 50% and water for injection.

**Dimenhydrinate Injection USP for IM administration or IV administration if diluted**

**Multidose vials 50 mg/mL**

*Active:* 50 mg dimenhydrinate.
*NMI:* benzyl alcohol 5%, propylene glycol 50% and water for injection.

**Dimenhydrinate Injection USP for IV administration**

**Single use vials 10 mg/mL**

*Active:* 10 mg dimenhydrinate.
*NMI:* ethyl alcohol 10% and water for injection

**Sandoz Dimenhydrinate Suppositories 50 mg**

*Active:* 50 mg dimenhydrinate.
*NMI:* hard fat.

**Sandoz Dimenhydrinate Suppositories 100 mg**

*Active:* 100 mg dimenhydrinate.
*NMI:* hard fat.

STORAGE AND STABILITY

Store Sandoz Dimenhydrinate (suppositories) below 25°C.

Dimenhydrinate Injection USP should be stored at controlled room temperature (15 - 30°C). Protect from freezing. Protect from light.

A test of dimenhydrinate solutions at pH 2 – 10 showed no separation or precipitation at pH 5.4 – 8.6 on extended room temperature storage. Below pH 5.4, a white powdery precipitate of 8-chloro-theophylline formed within 24 hours; above pH 8.6, an oily liquid separated within 30 min. The Handbook on Injectable Drugs should be consulted prior to mixing dimenhydrinate with other drugs.
A hydromorphone – dimenhydrinate combination was compatible and stable for 24 hours; by 48 hours, 8-chlorotheophylline had precipitated and the degree of precipitation was enhanced by increasing hydromorphone concentration.

A glycopyrrolate (Robinul) injectable (IM) – dimenhydrinate injectable (for IM administration) combination showed several tiny particles at 5 minutes and remained unchanged up to 48 hours. Despite a marginal amount, Carter-Horner interpreted the result as physically incompatible.

**AVAILABILITY OF DOSAGE FORMS**

- **Dimenhydrinate Injection USP For IM administration or IV administration if diluted 50 mg/mL**
  - For IM administration or IV administration if diluted. Each mL contains dimenhydrinate 50 mg, propylene glycol 50% and water for injection. (See Dosage and Administration, if used for IV administration).
  - Available in ampoules of 1 mL, boxes of 10 ampoules.

- **Dimenhydrinate Injection USP For IM administration or IV administration if diluted 50 mg/mL**
  - For IM administration or IV administration if diluted. Each mL contains dimenhydrinate 50 mg, benzyl alcohol 5%, propylene glycol 50% and water for injection. (See Dosage and Administration, if used for IV administration).
  - Available in multidose vials of 5 mL, boxes of 10.

  **LATEX-FREE STOPPER:** Stopper contains no dry natural rubber.

- **Dimenhydrinate Injection USP For IV administration 10 mg/mL**
  - For IV administration only. Each mL contains: dimenhydrinate 10 mg, ethyl alcohol 10% and water for injection. Available in single use vials of 5 mL, boxes of 10.

  **LATEX-FREE STOPPER:** Stopper contains no dry natural rubber.

- **Sandoz Dimenhydrinate Suppositories 50 mg**

- **Sandoz Dimenhydrinate Suppositories 100 mg**
  - Each suppository contains 100 mg dimenhydrinate, and fat. Boxes of 10.
PART II: SCIENTIFIC INFORMATION

PHARMACEUTICAL INFORMATION

Proper name: Dimenhydrinate

Chemical name: 8-chlorotheophyllinate of 2-[diphenylmethoxy]-n,n-dimethylethylamine

Other names: IS = Anautinum; Dommanate, Dramamine®, Gravol®

Chemical structure:

[Chemical structure image]

Molecular formula: \( C_{17}H_{21}NO \cdot C_7H_7ClN_4O_2 \)

Molecular weight: 469.98 g/mol

Physical properties:
Physical Form: White, crystalline, odorless powder

Solubility: Slightly soluble in water; freely soluble in ethanol and in chloroform; sparingly soluble in ether

\( \text{pH Value: } 7.1 - 7.6 \)

Melting Point Range: 102°C – 107°C
**TOXICOLOGY**

Acute toxicity was determined by administering dimenhydrinate to mice PO and IP, and in rats PO and IV. The results are shown in the following table.

PATIENT MEDICATION INFORMATION

DIMENHYDRINATE INJECTION USP

For IM administration or IV administration if diluted
50 mg/mL

For IV administration
10 mg/mL

SANDOZ DIMENHYDRINATE

Dimenhydrinate suppositories
50 mg and 100 mg

Read this carefully before you start taking Dimenhydrinate Injection USP or Sandoz Dimenhydrinate and each time you get a refill. This leaflet is a summary and will not tell you everything about these drugs. Talk to your healthcare professional about your medical condition and treatment and ask if there is any new information about Dimenhydrinate Injection USP or Sandoz Dimenhydrinate.

What are Dimenhydrinate Injection USP and Sandoz Dimenhydrinate used for?
Dimenhydrinate Injection USP and Sandoz Dimenhydrinate are used to prevent and relieve symptoms such as:
- Nausea
- vomiting and/or
- vertigo

These symptoms may be the result of:
- motion sickness

- Suppositories: 50 mg and 100 mg

**Do not use Dimenhydrinate Injection USP or Sandoz Dimenhydrinate if you:**

- are allergic to dimenhydrinate or any of the other ingredients in Dimenhydrinate Injection USP and Sandoz Dimenhydrinate (see What are the ingredients in Dimenhydrinate Injection USP and Sandoz Dimenhydrinate)

- take a Monoamine Oxidase Inhibitor (MAOI). Ask your healthcare provider or pharmacist if you are not sure if you take an MAOI, including the antibiotic linezolid and methylene blue. Do not:
  
  - Take an MAOI within 2 weeks of stopping Dimenhydrinate Injection USP and Sandoz Dimenhydrinate unless told to do so by your doctor
  
  - Start Dimenhydrinate Injection USP and Sandoz Dimenhydrinate if you stopped taking an MAOI in the last 2 weeks unless told to do so by your doctor

- Have glaucoma

- Have chronic lung disease including:
  
  - asthma
  
  - chronic obstructive pulmonary disease
- lower respiratory tract symptoms
- Have difficulty urinating due to an enlarged prostate
- Are 6 years old or younger for Dimenhydrinate Injection USP
- Are 12 years old or younger for Sandoz Dimenhydrinate

To help avoid side effects and ensure proper use, talk to your healthcare professional before you take Dimenhydrinate Injection USP or Sandoz Dimenhydrinate. Talk about any health conditions or problems you may have, including if you:
- have a history of heart problems, including high blood pressure
- have a history of seizures
- have problems with your thyroid
- have or had liver problems
- are pregnant or planning to become pregnant
- are breastfeeding or planning to breastfeed
- have porphyria (a condition that affects your hemoglobin)

Other warnings you should know about:
Do not take more than the recommended dose. At high doses, Dimenhydrinate Injection USP and Sandoz Dimenhydrinate can cause:
- confusion
- hallucinations
- temporary amnesia
- paranoia

Abuse: chronic abuse of Dimenhydrinate Injection USP or Sandoz Dimenhydrinate can lead to accidents, overdose, and in extreme cases to death. Dimenhydrinate Injection USP or Sandoz Dimenhydrinate should not be used for prolonged periods except on the advice of your doctor.

Driving and using machines: Before doing tasks that require special attention, wait until you know how you respond to Dimenhydrinate Injection USP or Sandoz Dimenhydrinate.

Pregnancy: Do not take Dimenhydrinate Injection USP or Sandoz Dimenhydrinate for nausea or vomiting while pregnant unless told to do so by your doctor.

Tell your healthcare professional about all the medicines you take, including any drugs, vitamins, minerals, natural supplements or alternative medicines.

The following may interact with Dimenhydrinate Injection USP or Sandoz Dimenhydrinate:
- Alcohol
- Some drugs used to treat depression (MAO inhibitors)
- Drugs used to help you sleep such as:
  - barbiturates
  - sedatives
  - hypnotics
- Drugs used to reduce tension or anxiety (such as tranquilizers)

To avoid an overdose, you should use caution when taking Dimenhydrinate Injection USP or Sandoz Dimenhydrinate with these types of drugs.
- Drugs used to treat allergies or allergic reactions (antihistamines)
- Drugs that can cause damage to the ear (called ototoxic drugs). If you take dimenhydrinate in combination with certain antibiotics or other drugs that can cause damage to the ear, you may not be able to see the early symptoms of ototoxicity.

How to take Dimenhydrinate Injection USP and Sandoz Dimenhydrinate:

**Dimenhydrinate Injection USP for IM administration is for intramuscular use only.**

If used for intravenous (IV) administration, Dimenhydrinate Injection USP 50 mg/mL must be diluted at least one to ten with a compatible physiological solution (such as sterile saline or 5% dextrose and water). Diluted Dimenhydrinate Injection USP for IM administration, prepared for IV use, should be administered by **SLOW INTRAVENOUS INJECTION ONLY** (over 2 minutes).

For IV administration, the Dimenhydrinate Injection USP (10 mg/mL) must be administered as a slow IV injection (2 to 4 minutes).

*For Motion Sickness*

**Adults**

**Rectal:**
**Usual dose:** 50 mg - 100 mg Sandoz Dimenhydrinate suppository every 6 to 8 hours as needed. For ease and comfort, smooth any edges on suppository prior to use. Dosage should be taken at least 30 minutes, and preferably 1 or 2 hours before travelling. Do not use more than 4 suppositories in 24 hours.

**Children**

**12 years of age and older:**

**Rectal:**
**Usual dose:** 50 mg every 8 to 12 hours as needed. Dosage should be taken at least 30 minutes, and preferably 1 or 2 hours before travelling. Do not use more than 3 suppositories in 24 hours.

For *Radiation Sickness*

**Pre-Therapy:**
**Usual adult dose:** 50 mg – 100 mg given rectally or by injection, 30 to 60 minutes before treatment
**Maximum daily dose:** This dose can be given again up to 400 mg a day
To divide a suppository in two equal parts, remove from packaging and carefully cut with a sharp edge blade through the suppository.

Post-therapy:
Usual adult dose: 50 mg given IM or by IV 1.5 hours after therapy and 50 given mg IM or by IV 3 hours - after therapy

Postoperative Nausea/Vomiting

**Adults**
Usual pre-operative dose: 50 mg IM or by IV
Usual post-operative dose: 50 mg IM or by IV
Maximum daily dose: 400 mg a day

**Children**
Usual dose for Over 12 years of age: 50 mg given IM or by IV 2 or 3 times a day
Usual dose for 8 to 12 years of age: 25 mg - 50 mg given IM or by IV 2 or 3 times a day
Usual dose for 6 to 7 years of age: 15 mg - 25 mg given IM or by IV 2 or 3 times a day

Post-surgical/Post-anesthetic

**Adults:**
Usual dose: 50 mg given IM or by IV immediately after surgery. Then 50 mg given IM or by IV every 4 hours for 3 doses

**Children:**
Usual dose for Over 12 years of age: 50 mg given IM or by IV 2 or 3 times a day
Usual dose for 8 to 12 years of age: 25 mg - 50 mg given IM or by IV 2 or 3 times a day
Usual dose for 6 to 7 years of age: 15 mg - 25 mg given IM or by IV 2 or 3 times a day

**Overdose:**
If you think you have taken too much Dimenhydrinate Injection USP or Sandoz Dimenhydrinate, contact your healthcare professional, hospital emergency department or regional Poison Control Centre immediately, even if there are no symptoms.

**Missed Dose:**
If you miss a dose and you are taking it regularly, take it as soon as possible. If it is almost time for your next dose, skip the missed dose and go back to your regular dosing schedule. Do not take 2 doses at once. Do not exceed the maximum daily dose.

What are possible side effects from using Dimenhydrinate Injection USP or Sandoz Dimenhydrinate?
These are not all the possible side effects you may feel when taking Dimenhydrinate Injection USP or Sandoz Dimenhydrinate. If you experience any side effects not listed here, contact your healthcare professional.

- drowsiness
- dizziness
- pain may occur at the site of IM injection
- dry mouth
- fatigue, excitement
- nausea

**Skin Rash:** If you experience a skin rash after taking Dimenhydrinate Injection USP or Sandoz Dimenhydrinate, you should contact your doctor or pharmacist for assessment and advice.
